## A NOTE ON CURVATURE

$01^{\circ}$ Let $\Omega$ be a region in $\mathbf{R}^{2}$ and let $H$ be a mapping carrying $\Omega$ to $\mathbf{R}^{3}$ :

$$
H(u, v)=\left(\begin{array}{l}
a(u, v) \\
b(u, v) \\
c(u, v)
\end{array}\right)
$$

where $a, b$, and $c$ are functions defined on $\Omega$ and where $(u, v)$ is any point in $\Omega$. Of course, $H$ serves to parametrize a surface $S=H(\Omega)$ in $\mathbf{R}^{3}$. Let $H_{u}$ and $H_{v}$ be the mappings carrying $\Omega$ to $\mathbf{R}^{3}$ defined, as usual, by the first and second columns of the total derivative $D H$ of $H$ :

$$
D H(u, v)=\left(\begin{array}{ll}
H_{u}(u, v) & H_{v}(u, v)
\end{array}\right)=\left(\begin{array}{ll}
a_{u}(u, v) & a_{v}(u, v) \\
b_{u}(u, v) & b_{v}(u, v) \\
c_{u}(u, v) & c_{v}(u, v)
\end{array}\right)
$$

Let $N$ be the unit normal mapping carrying $\Omega$ to $\mathbf{R}^{3}$ :

$$
N(u, v) \equiv \frac{1}{\left\|H_{u}(u, v) \times H_{v}(u, v)\right\|} H_{u}(u, v) \times H_{v}(u, v)=\left(\begin{array}{c}
\alpha(u, v) \\
\beta(u, v) \\
\gamma(u, v)
\end{array}\right)
$$

where $\alpha, \beta$, and $\gamma$ are suitable functions defined on $\Omega$. Of course, the range of $N$ is included in the unit sphere $\mathbf{S}^{2}$. In this context, one refers to $N$ as the Gauss Map, relative to the parametrization $H$.
$02^{\circ}$ Let $\rho$ be the surface area 2-form for $S$ on $\mathbf{R}^{3}$. We know that:

$$
H^{*}(\rho)=\left\|H_{u}(u, v) \times H_{v}(u, v)\right\| d u d v
$$

As usual, let $\sigma$ be the surface area 2-form for $\mathbf{S}^{2}$ on $\mathbf{R}^{3}$ :

$$
\sigma=x d y d z+y d z d x+z d x d y
$$

Of course, there must be a function $\kappa$ defined on $\Omega$ such that:

$$
N^{*}(\sigma)=\kappa H^{*}(\rho)
$$

We plan to show that $\kappa$ defines the curvature of $S$.
$03^{\circ}$ To prepare the way, let us recall the following identity:

$$
(A \times B) \bullet(C \times D)=(A \bullet C)(B \bullet D)-(B \bullet C)(A \bullet D)
$$

where $A, B, C$, and $D$ are any vectors in $\mathbf{R}^{3}$.
$04^{\circ}$ In particular, we find the following expression for the determinant $\gamma$ of the First Fundamental Form $G$ for $S$, relative to the parametrization $H$ :

$$
\gamma=\left\|H_{u} \times H_{v}\right\|^{2}=\left(H_{u} \bullet H_{u}\right)\left(H_{v} \bullet H_{v}\right)-\left(H_{u} \bullet H_{v}\right)^{2}
$$

where:

$$
G \equiv\left(\begin{array}{cc}
H_{u} \bullet H_{u} & H_{u} \bullet H_{v} \\
H_{v} \bullet H_{u} & H_{v} \bullet H_{v}
\end{array}\right)
$$

In turn, we find the following expression for the determinant $\lambda$ of the Second Fundamental Form $L$ for $S$, relative to the parametrization $H$ :

$$
\lambda=\left(H_{u} \times H_{v}\right) \bullet\left(N_{u} \times N_{v}\right)=\left(H_{u} \bullet N_{u}\right)\left(H_{v} \bullet N_{v}\right)-\left(H_{v} \bullet N_{u}\right)\left(H_{u} \bullet N_{v}\right)
$$

where:

$$
L \equiv\left(\begin{array}{ll}
H_{u u} \bullet N & H_{u v} \bullet N \\
H_{v u} \bullet N & H_{v v} \bullet N
\end{array}\right)
$$

To see that $\lambda$ equals $\operatorname{det}(L)$, we observe that $H_{u} \bullet N=0$ and $H_{v} \bullet N=0$, so that:

$$
\begin{aligned}
& H_{u u} \bullet N+H_{u} \bullet N_{u}=0 \\
& H_{u v} \bullet N+H_{u} \bullet N_{v}=0 \\
& H_{v u} \bullet N+H_{v} \bullet N_{u}=0 \\
& H_{v v} \bullet N+H_{v} \bullet N_{v}=0
\end{aligned}
$$

$05^{\circ}$ Finally, we find that:

$$
\begin{aligned}
N^{*}(\sigma) & =N^{*}(x d y d z+y d z d x+z d x d y) \\
& =\alpha d \beta d \gamma+\beta d \gamma d \alpha+\gamma d \alpha d \beta \\
& =\left[\alpha\left(\beta_{u} \gamma_{v}-\beta_{v} \gamma_{u}\right)+\beta\left(\gamma_{u} \alpha_{v}-\gamma_{v} \alpha_{u}\right)+\gamma\left(\alpha_{u} \beta_{v}-\alpha_{v} \beta_{u}\right)\right] d u d v \\
& =N \bullet\left(N_{u} \times N_{v}\right) d u d v \\
& =\frac{1}{\left\|H_{u} \times H_{v}\right\|}\left(H_{u} \times H_{v}\right) \bullet\left(N_{u} \times N_{v}\right) d u d v \\
& =\frac{1}{\left\|H_{u} \times H_{v}\right\|^{2}}\left(H_{u} \times H_{v}\right) \bullet\left(N_{u} \times N_{v}\right)\left\|H_{u} \times H_{v}\right\| d u d v \\
& =\frac{\lambda}{\gamma} H^{*}(\rho)
\end{aligned}
$$

We conclude that:

$$
\kappa=\frac{\lambda}{\gamma}
$$

Hence, $\kappa$ defines the curvature of $S$.
